

How to Set up a Plug on Android

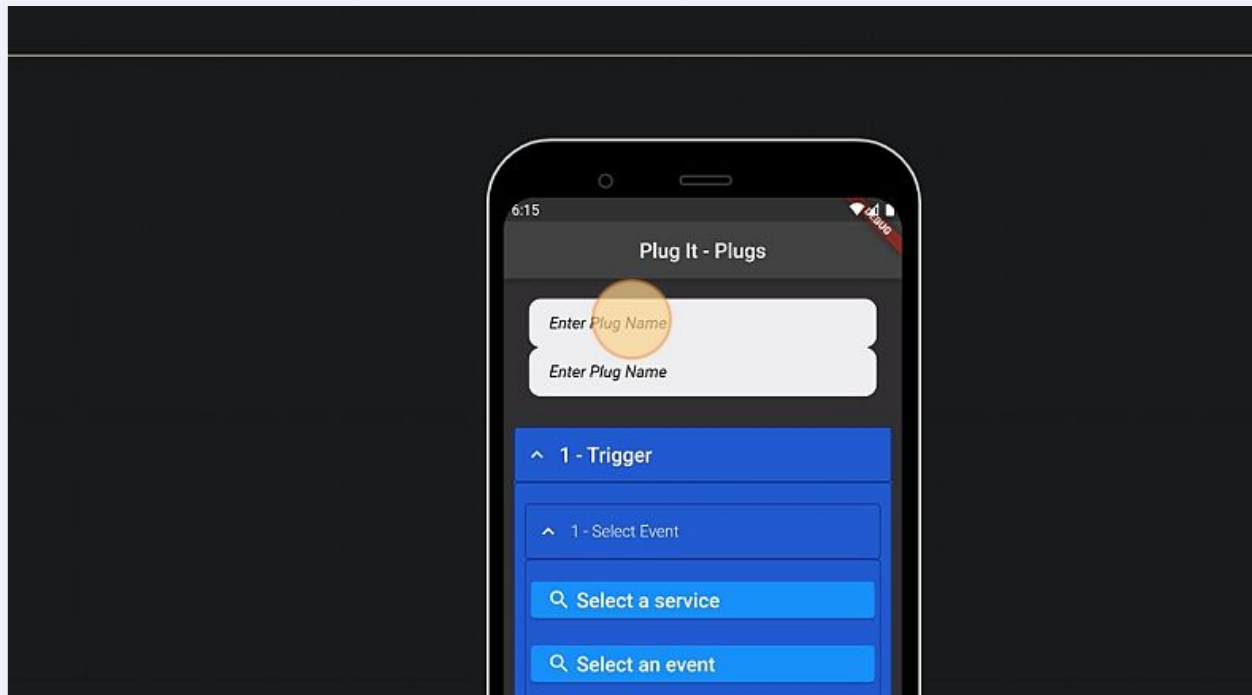

- 1 From your home or any other tab select the plug icon.

2 Click the "Create"

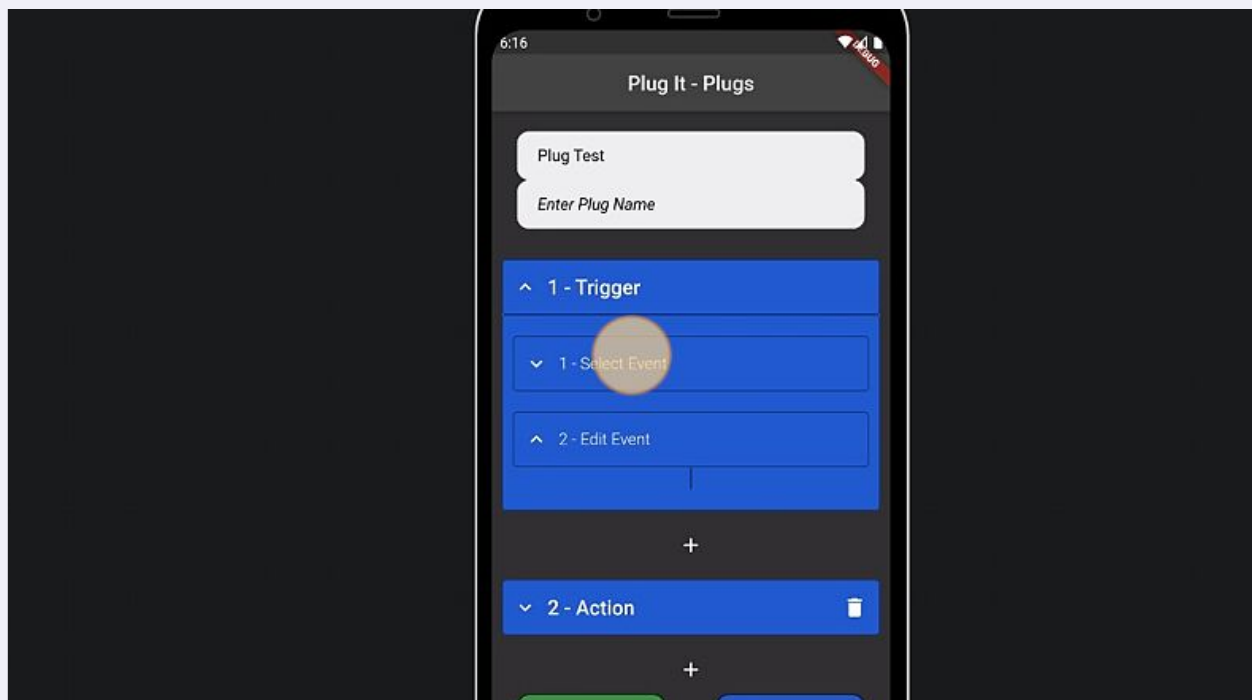

3 Then click on "Enter Plug Name"

4 Type the name of the plug you want.

Setup the Trigger

5 Click on "Select Event" in the "Trigger" card.

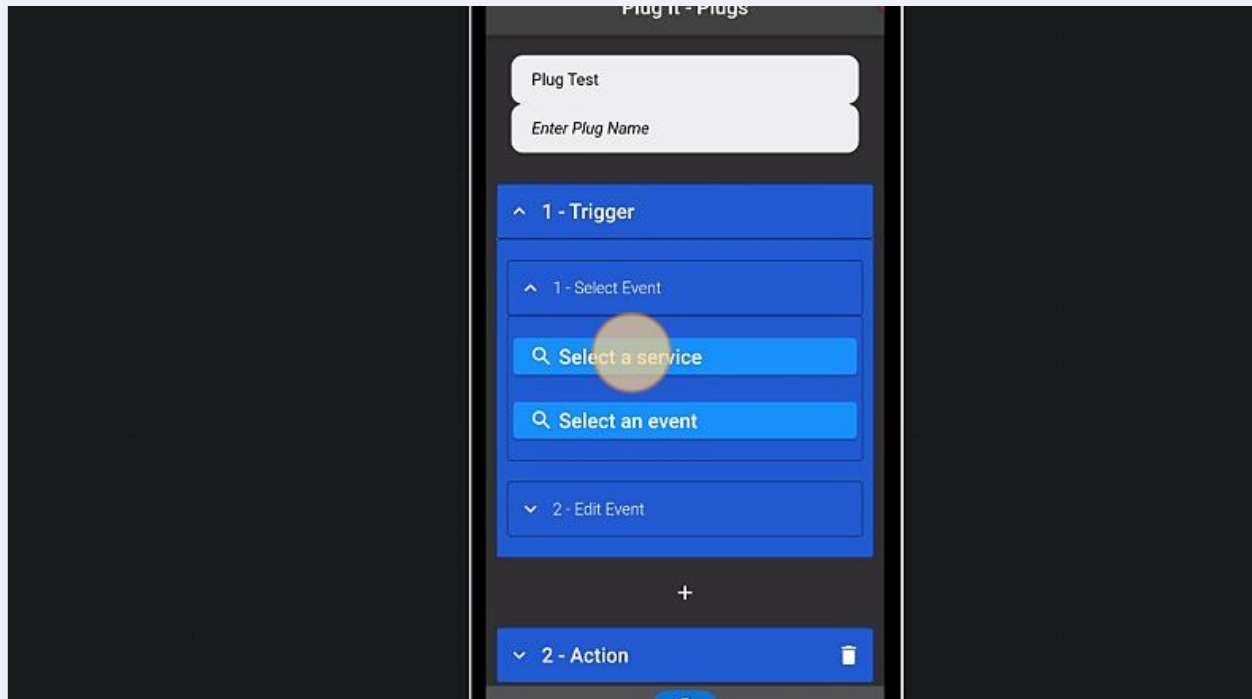

Trigger will be the event that will start the sequence of actions you will define later.

In this example we will use YouTube as a trigger by using the video publishing event to send a Discord message with the video informations.

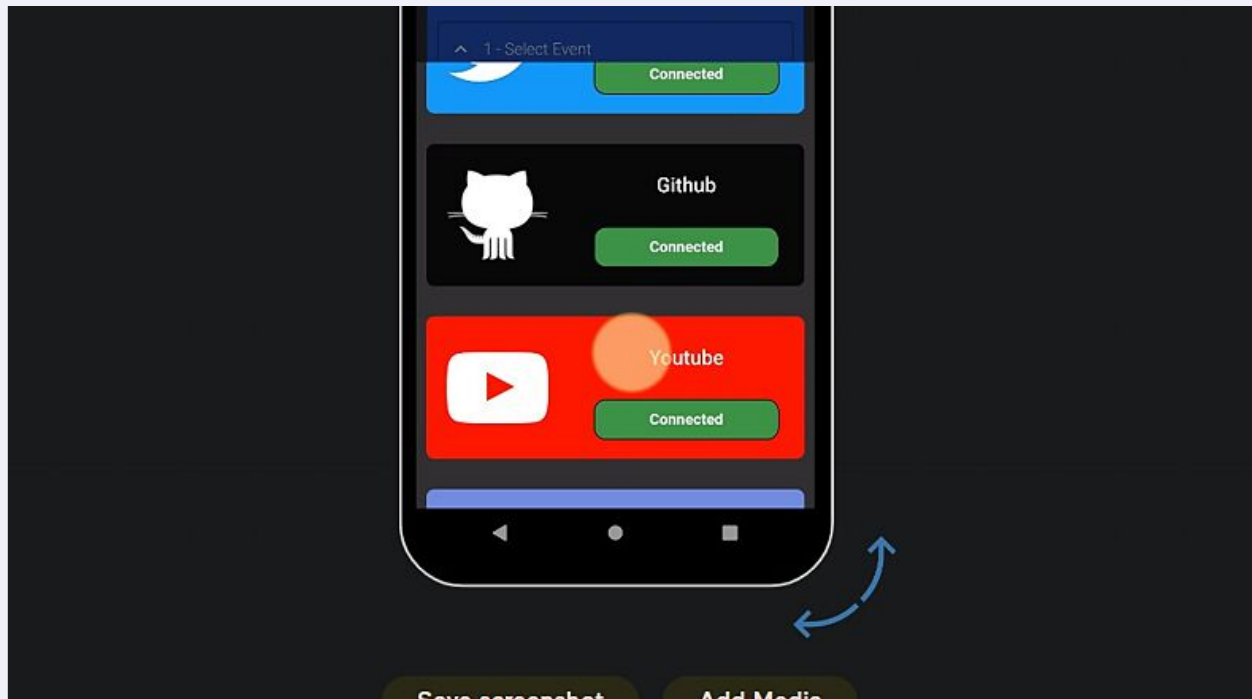

6

Click on "Select a service" in the "Trigger" card inside the "Select Event" section to select the service that will be used to start the plug.

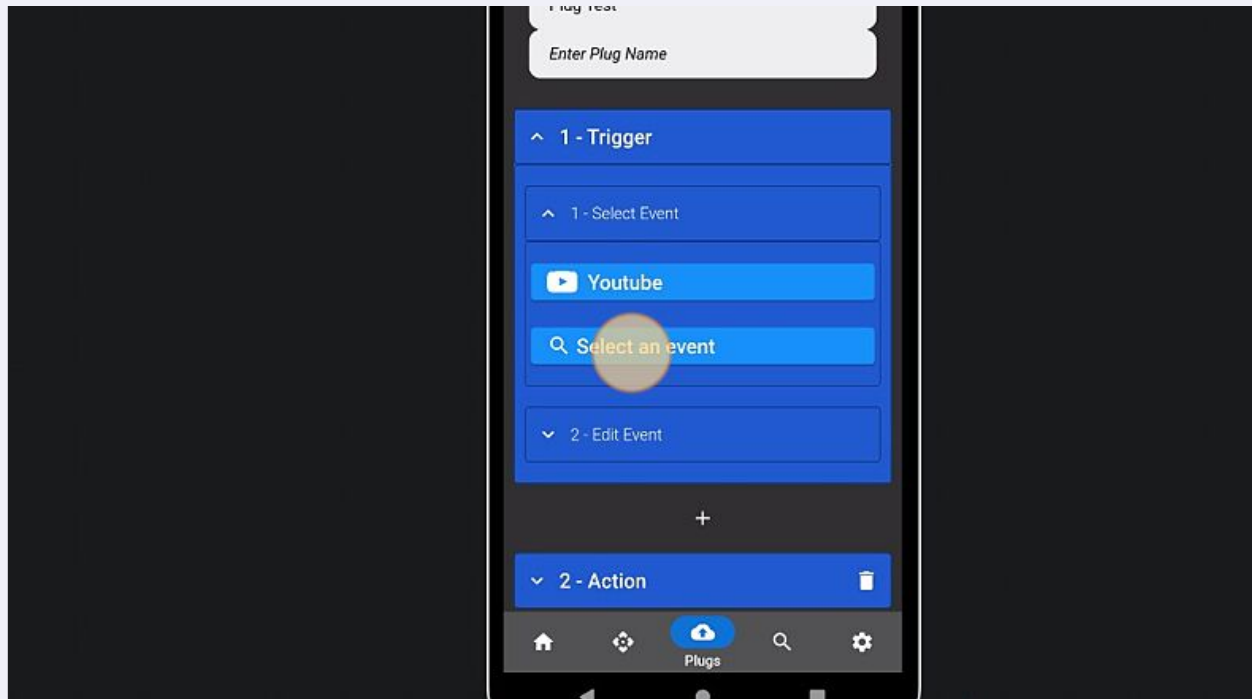

7

Click on the service you want to use.
Ex: YouTube

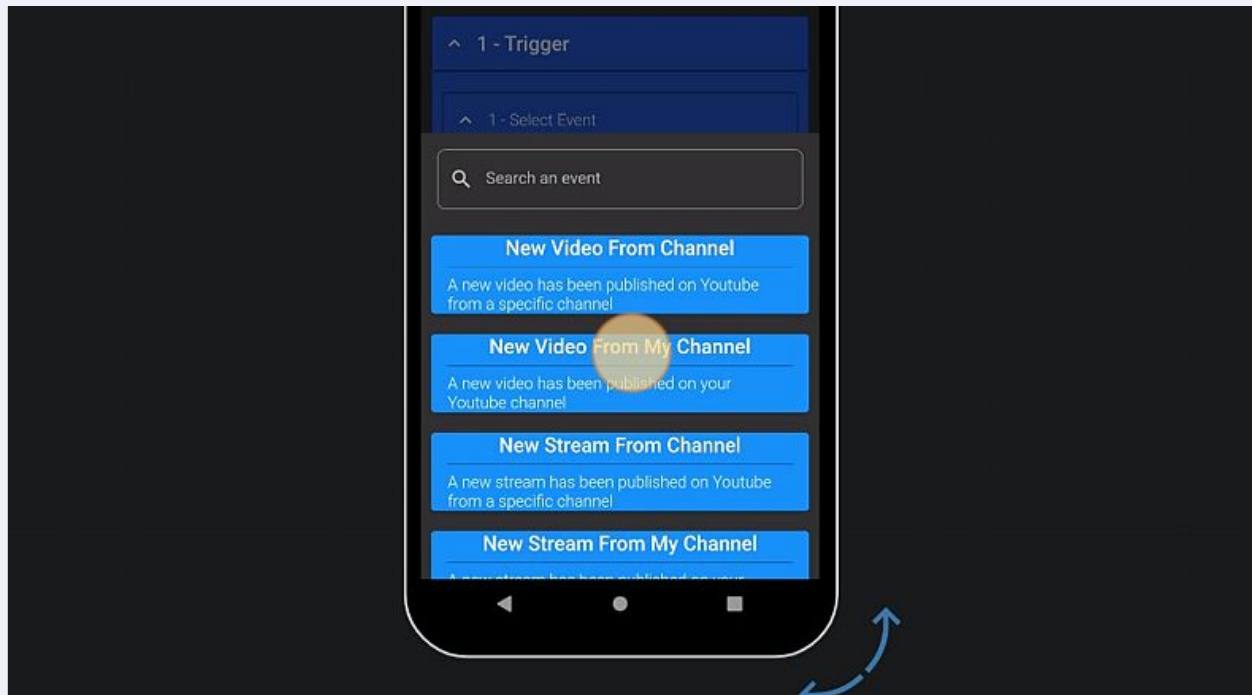

8

Click on "Select an event" in the "Trigger" card inside the "Select Event" section to select the service that will be used to start the plug.

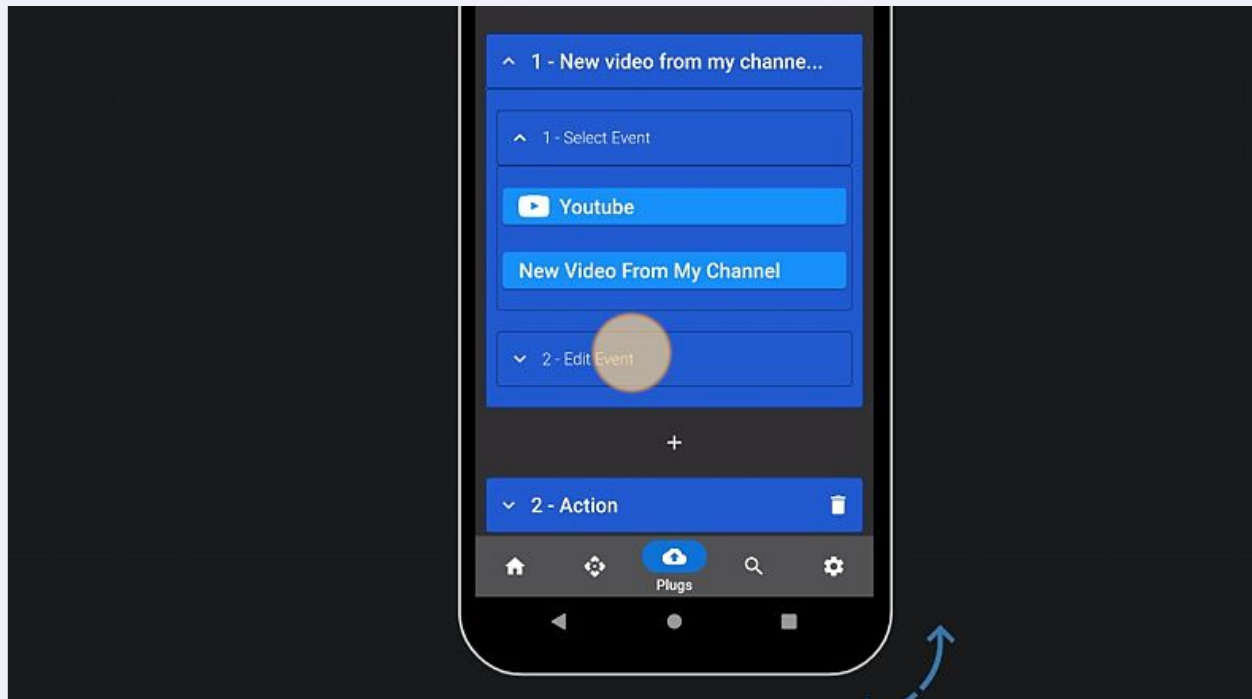

9

Click on the event you want to use.
Ex: "New Video From Channel"

10

(May not be required) Some services and events require additional values to work. Click on "Edit Event" to check the required fields.

11

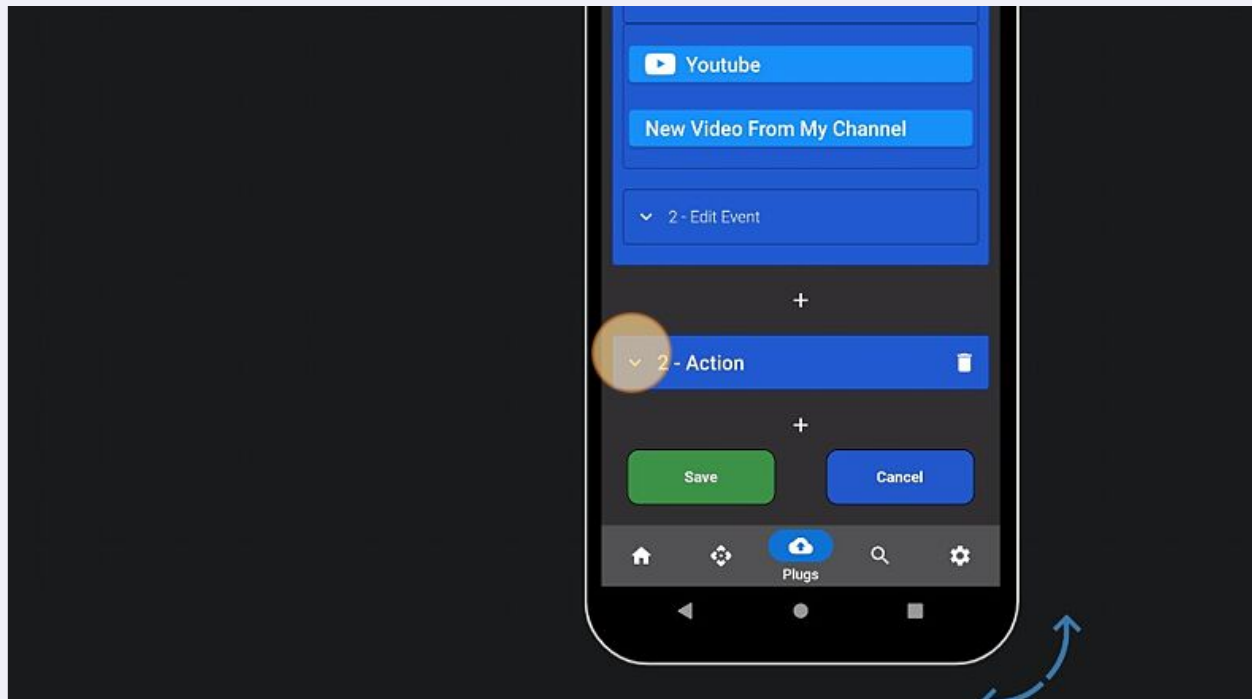

(May not be required) If some values are required click on the text zone and fill the required informations.

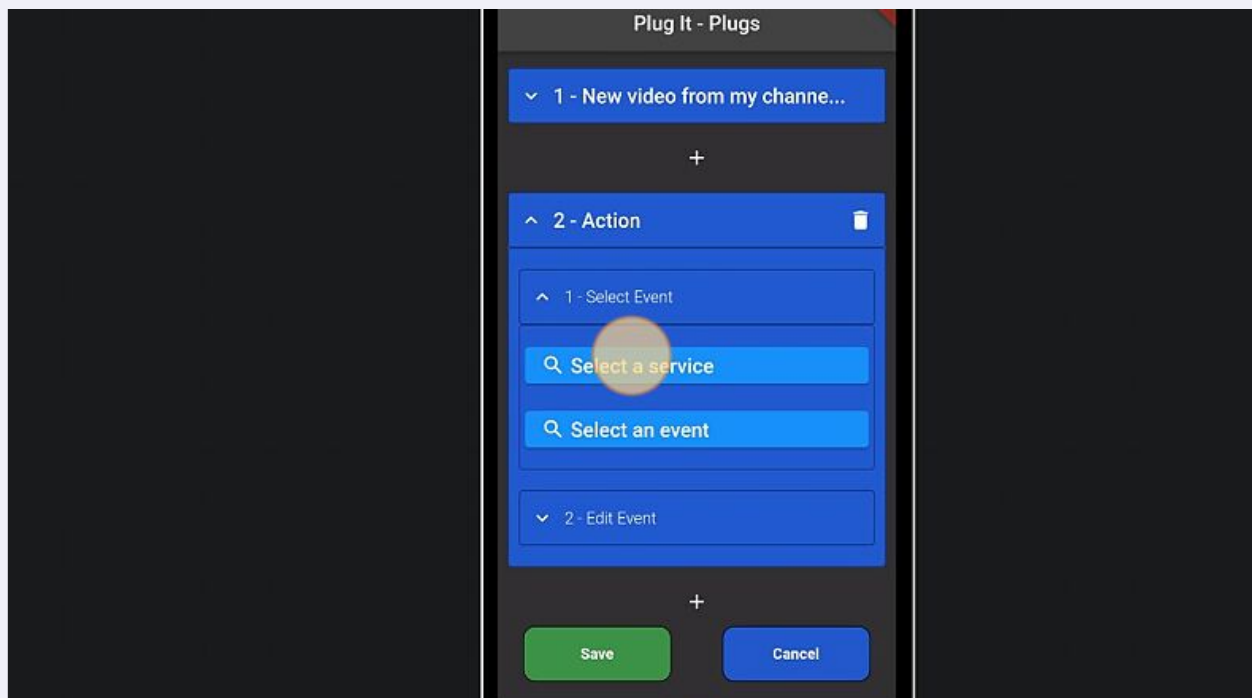

Congratulation! The first step to setup the plug is now completed, now you need to setup at least one action that will be executed when the Trigger is started.

Setup the first Action

12 Click on "Action".

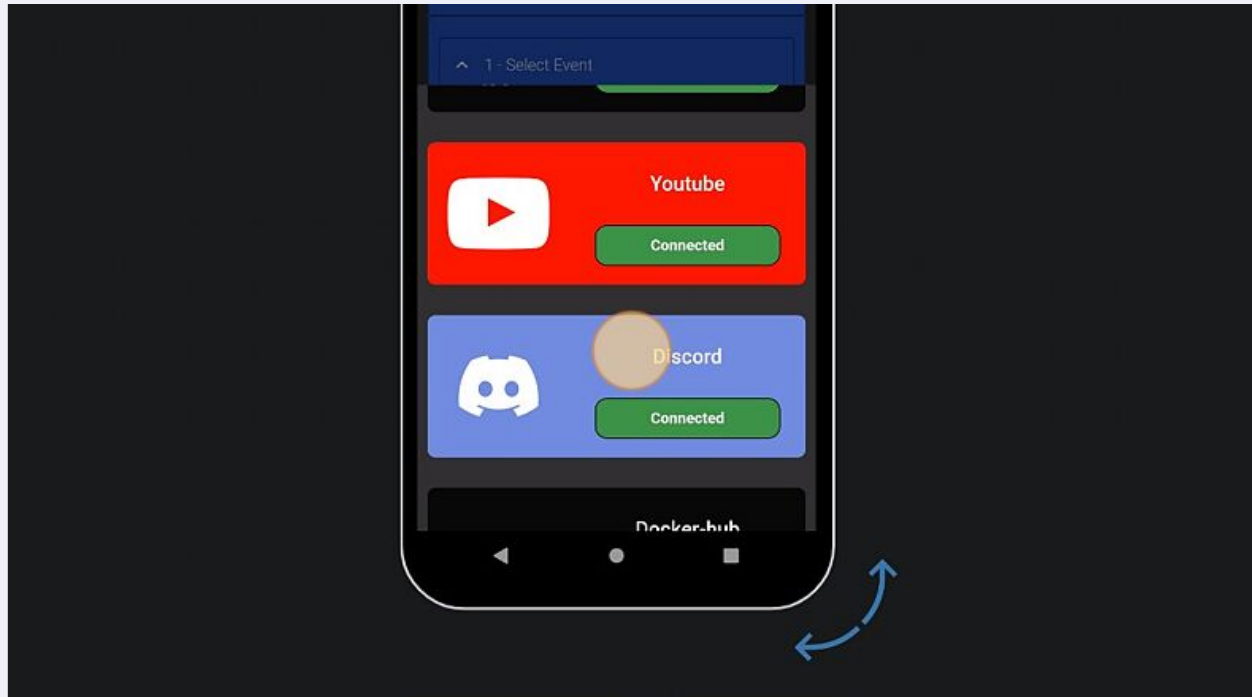

13 Click on "Select a service".

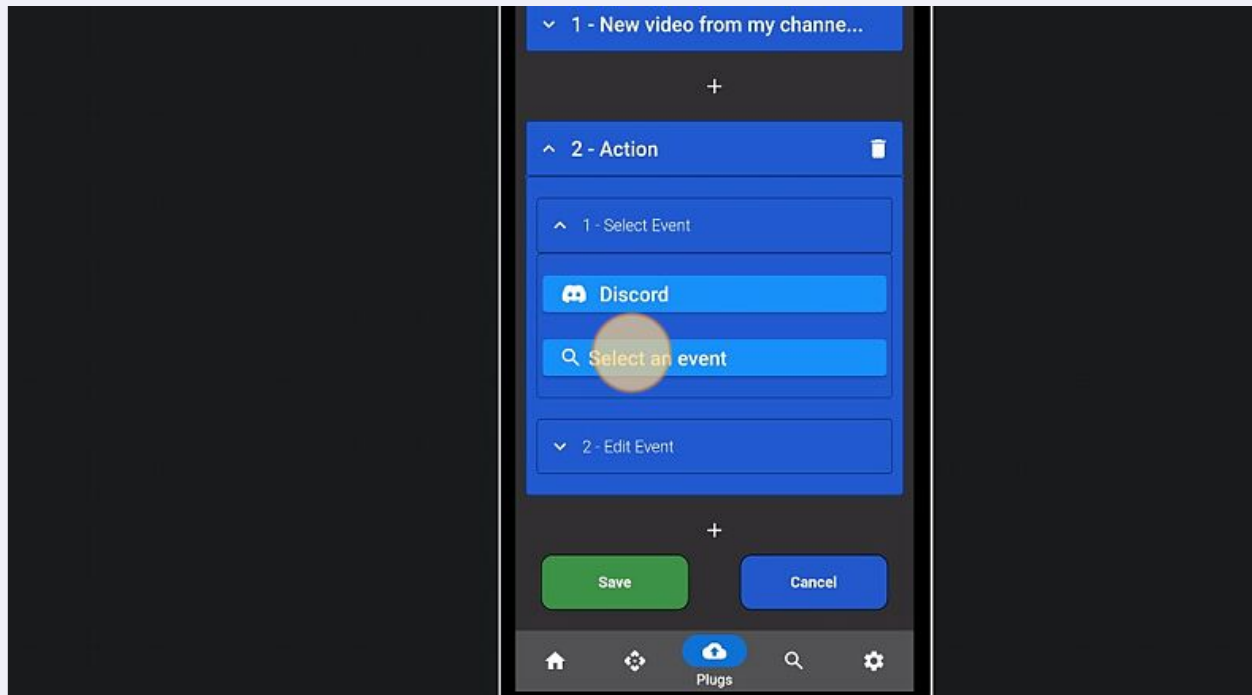

14

Select the service that will be used by your action.
Ex: discord

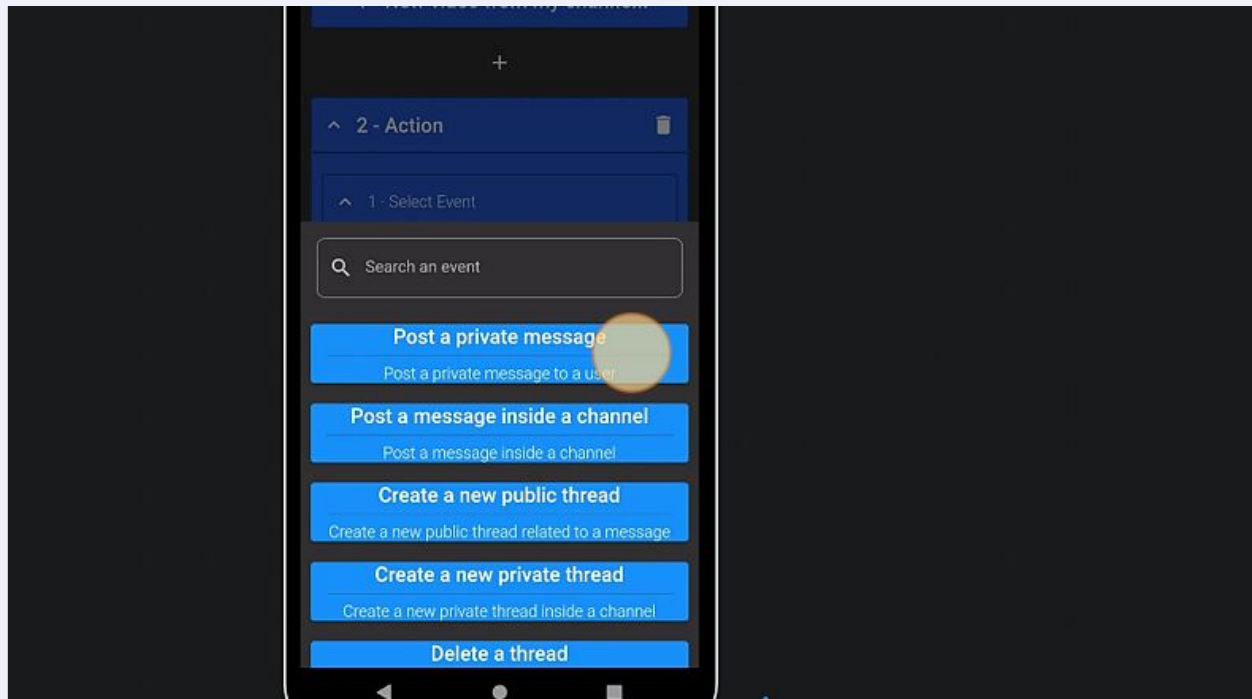

15

Click on "Select an event".

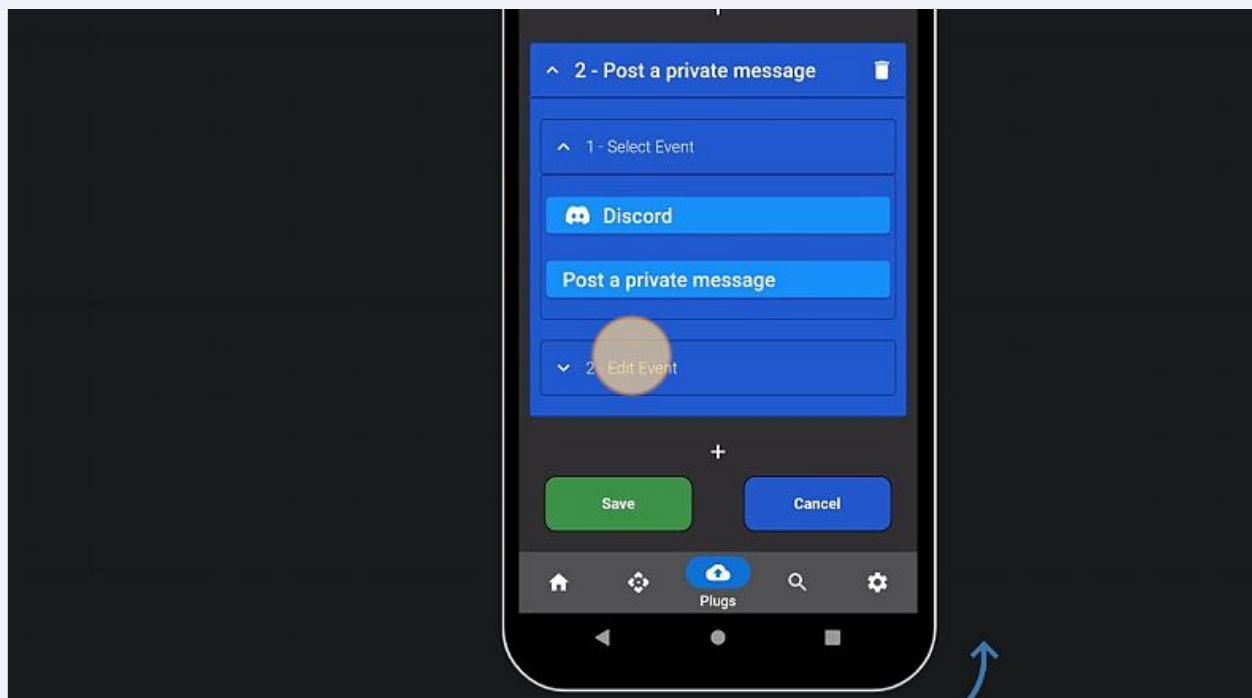

16

Click on the action you want to use.
Ex: "Post a private message"

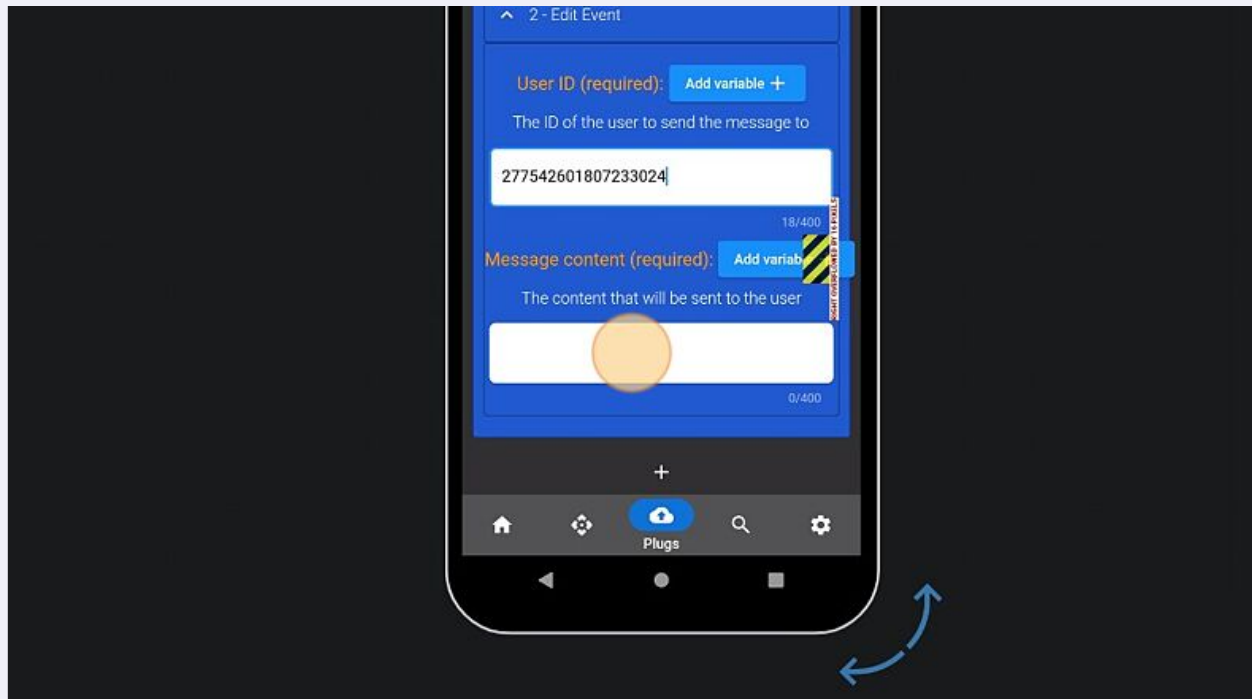

17

(May not be required) Some services and actions require additional values to work. Click on "Values" to check the required fields.

18

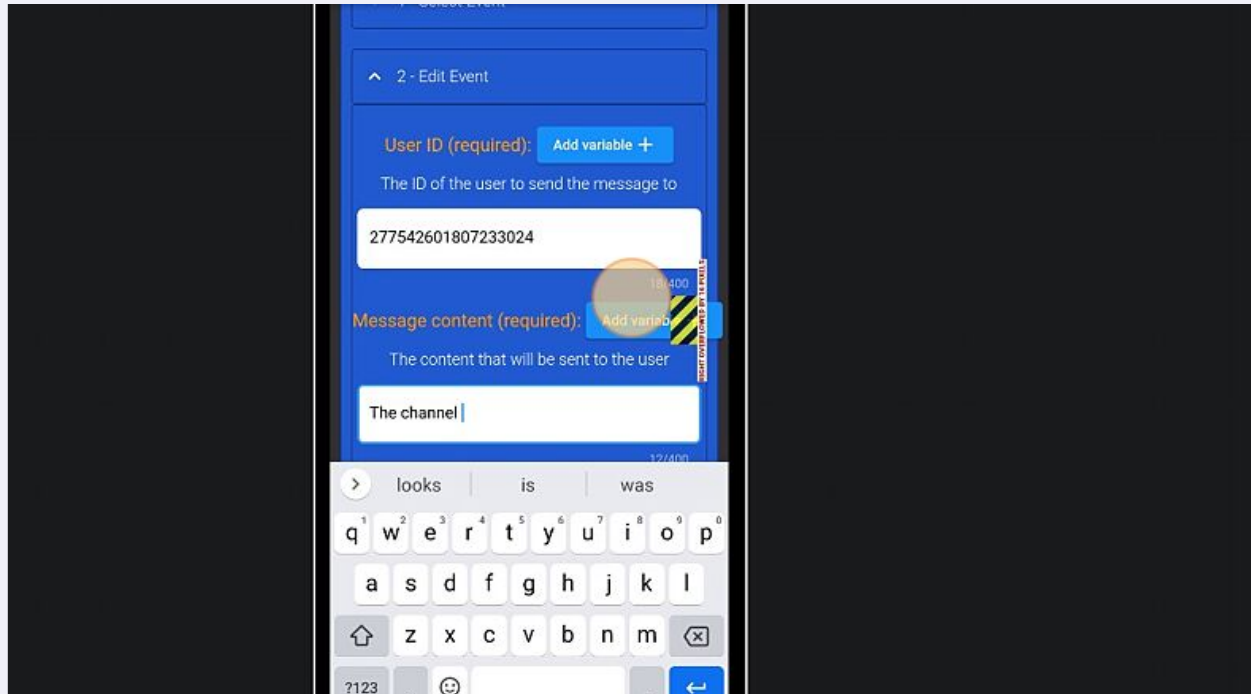

(May not be required) If some values are required click on the text zone and fill the required informations.

(Optional) Use Variables in "Edit Event" Sections

19

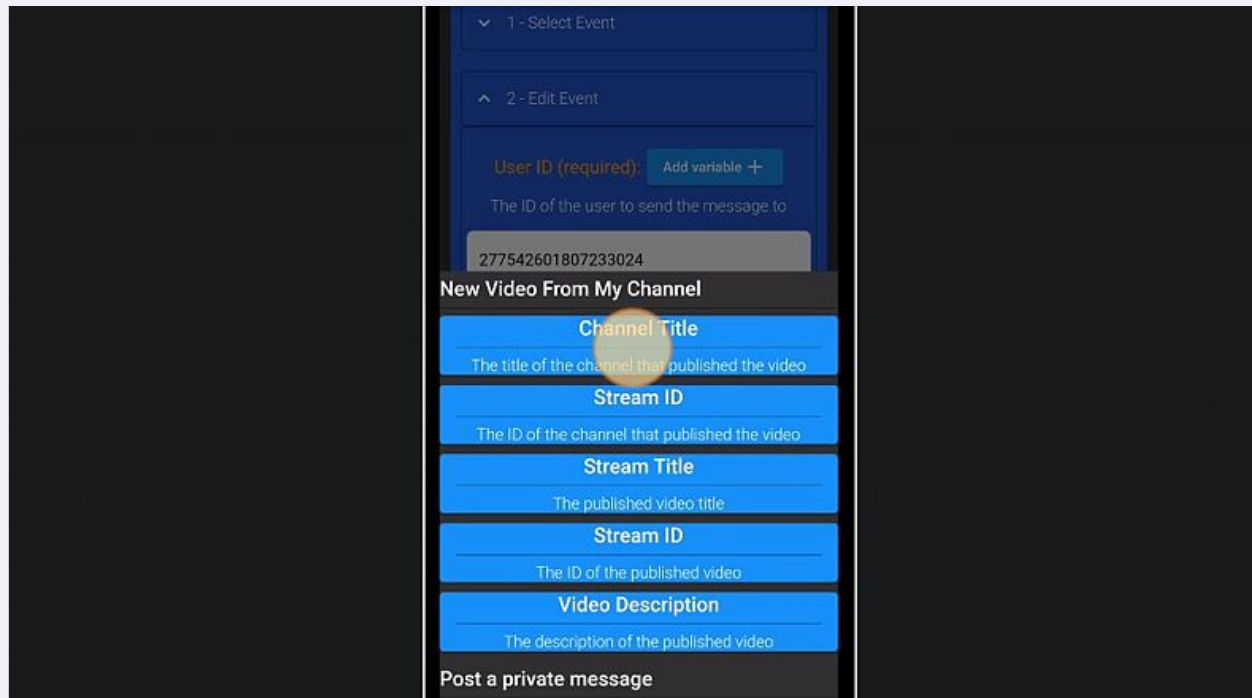

At any moment in the "Edit Event" section of an action, you can use "variables" to add the data created by a previous action or by the trigger. Click on the button "Add variable" associated with the right input field. Ex: Add to a message the channel and video informations (the result of the trigger)

20

Click on the variable you want to use, each new trigger or action is separated by a section title. This allows you to choose the right variable for a specific action or trigger.

Ex: "Channel Title"

Selecting a variable will add a special tag to your input field. It should look like "\${X.X}", this is a normal behaviour, it represents the value you have selected and will be updated dynamically when executed!

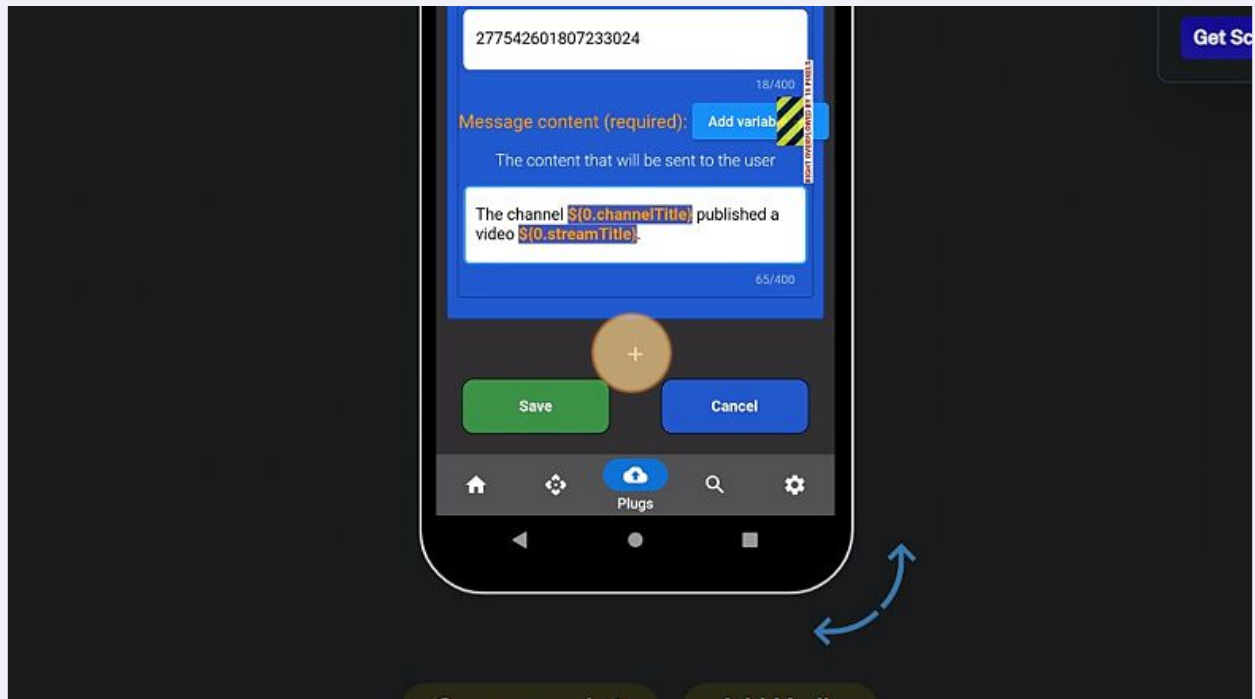

21

(Optional) You can at any moment click again on "Add variable" to add new variables to your input.

Note: You can use a same variable multiple times.

(Optional) Add more than one action

22 Click on the "+" icon.

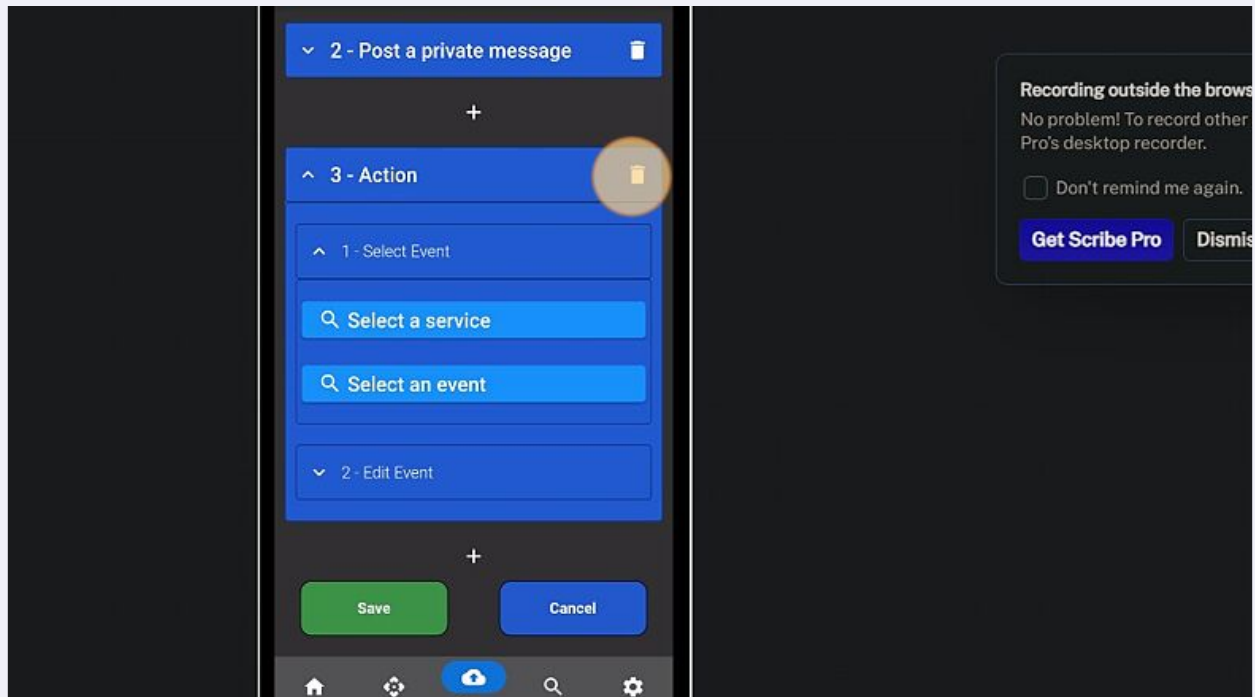

(Optional) Delete an action

Alert! Be very carefull when deleting an action, this will not update all the variables of your actions. You will need to select them all again to have the correct tag.

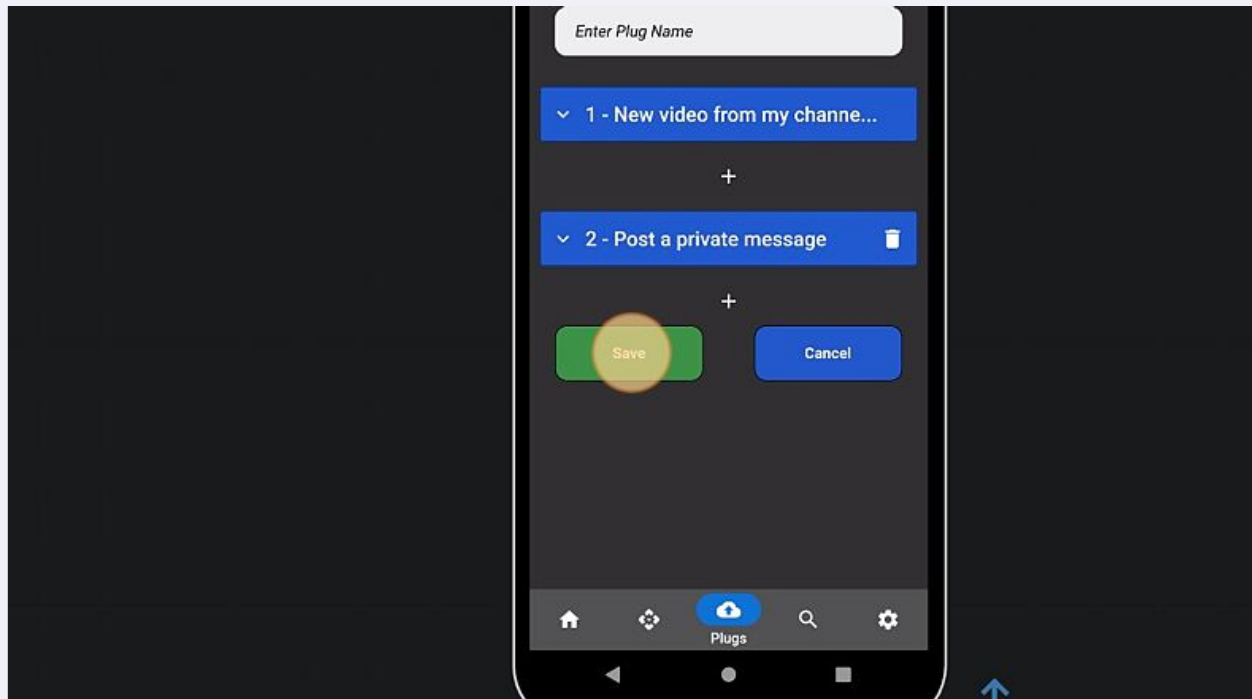

23

Click on the trash icon in the action card you want to delete.

Create the plug

24 Click on "Save"

If you are redirected to the plug page and can see your plug, congratulations! You have successfully created your plug.
